

Personal Statement - Documento Escrito GA7- 240202501-AA1-EV01

Nombre

Meyer Romero, David Alejandro

Programa

Tecnología en Análisis y Desarrollo de Software (ADSO)

Fecha

24 de septiembre de 2026

Personal Statement: Backend Developer and Systems Analyst Candidate

Who Am I?

My name is David Alejandro Meyer Romero, an enthusiastic systems learner and technologist currently pursuing the Software Analysis and Development (ADSO) program at SENA in Bogotá.

I define myself as an analytical, self-taught, highly structured, and persevering individual who approaches every technological challenge with logic and persistence. Parallel to my official studies, I have proactively expanded my technical profile by earning verified microcredentials from IBM SkillsBuild and Cisco Networking Academy in areas such as Python essentials, Data Fundamentals, Cloud Security, Incident Response, and AI Fundamentals.

I am deeply passionate about how code, data management, and security protocols interact to build dependable systems.

My continuous learning mindset drives me to constantly explore new tools, refine my reasoning abilities, and adapt swiftly to modern tech ecosystems.

What Program or Position Am I Applying For?

I am applying for the position of Junior Backend Developer within a dynamic tech company.

My ambition is to join an engineering environment where I can actively participate in building scalable server-side logic, managing relational databases, and integrating secure APIs.

Given my combined training in software engineering and IT security operations, I aim to contribute to creating robust, high-performing software infrastructure while growing as an integral software developer.

Why Am I Fit for This Position?

I am well-equipped for this role because my academic and self-directed path directly aligns with the technical demands of backend engineering.

Through my ADSO program and individual certifications, I have acquired functional hands-on knowledge in programming languages such as Python, C, C++, and SQL for basic data querying and manipulation.

Beyond technical capabilities, my learning experience at SENA has strengthened critical core skills like time management, structured problem-solving, and cross-functional teamwork under agile methods.

To illustrate my problem-solving approach and adaptability, during a major course project, my development team faced significant challenges regarding software documentation and requirements engineering, specifically when drafting the IEEE 830 specification document and organizing initial data collection.

Instead of compromising project quality, I took the initiative to convene an internal working session.

We carefully evaluated our team's knowledge gaps, researched academic guidelines, and analyzed documentation frameworks together.

Through active listening and structured technical research, we reached a unified consensus, resolved the ambiguities, and successfully completed the software requirement specification on time.

This experience reinforced the importance of critical thinking, effective communication, and collaborative resilience in the software development lifecycle.

What Are My Future Goals?

My short-term goal is to secure a full-time position as a Backend Developer in an innovative technology firm, where I can consolidate my commercial software engineering experience.

Concurrently, I plan to initiate my undergraduate degree in Mechatronics Engineering and achieve certified fluency in English (B2/C1 level) alongside conversational German (B1 level).

In the long run, over the next three to five years, I envision myself earning a Master's Degree in Robotics and working directly within the Research and Development (R&D) department of an advanced robotics or automation enterprise.

Combining my strong foundation as a SENA ADSO technologist, my expertise in Mechatronics, and my passion for artificial intelligence, I aspire to lead cutting-edge engineering projects that bridge software intelligence with physical automated systems.
